這些不均勻分布的分子通常為”工具分子”，能影響基因表現  
(轉錄開啟或關閉)

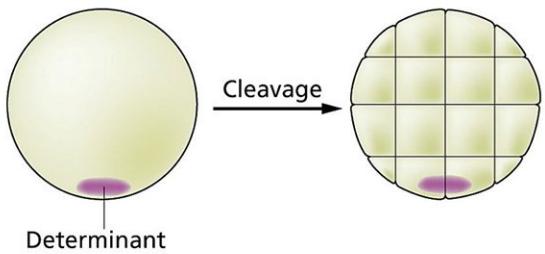

工具分子包括：

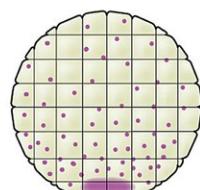

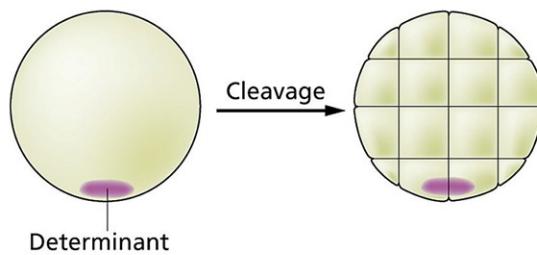

1. **轉錄因子**：在細胞核內會與DNA結合，調控基因表現
2. **訊息分子**：會分泌到細胞外經由訊息傳遞至細胞內影響轉錄因子的活性

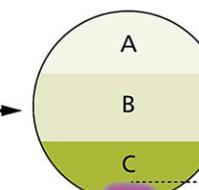

在受精卵內分佈不平均的轉錄因子或訊息分子，在早期卵裂過程中，只有部分細胞含有這些工具分子，因此基因在胚胎的不同部位有不同的調控方式

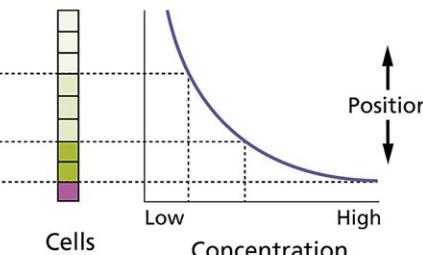

分佈不平均的轉錄因子，僅在其存在細胞開啟下游基因

# 海膽胚胎的中內胚層發育基因調控網路

Endomesoderm Specification up to 30 Hours

November 21, 2011

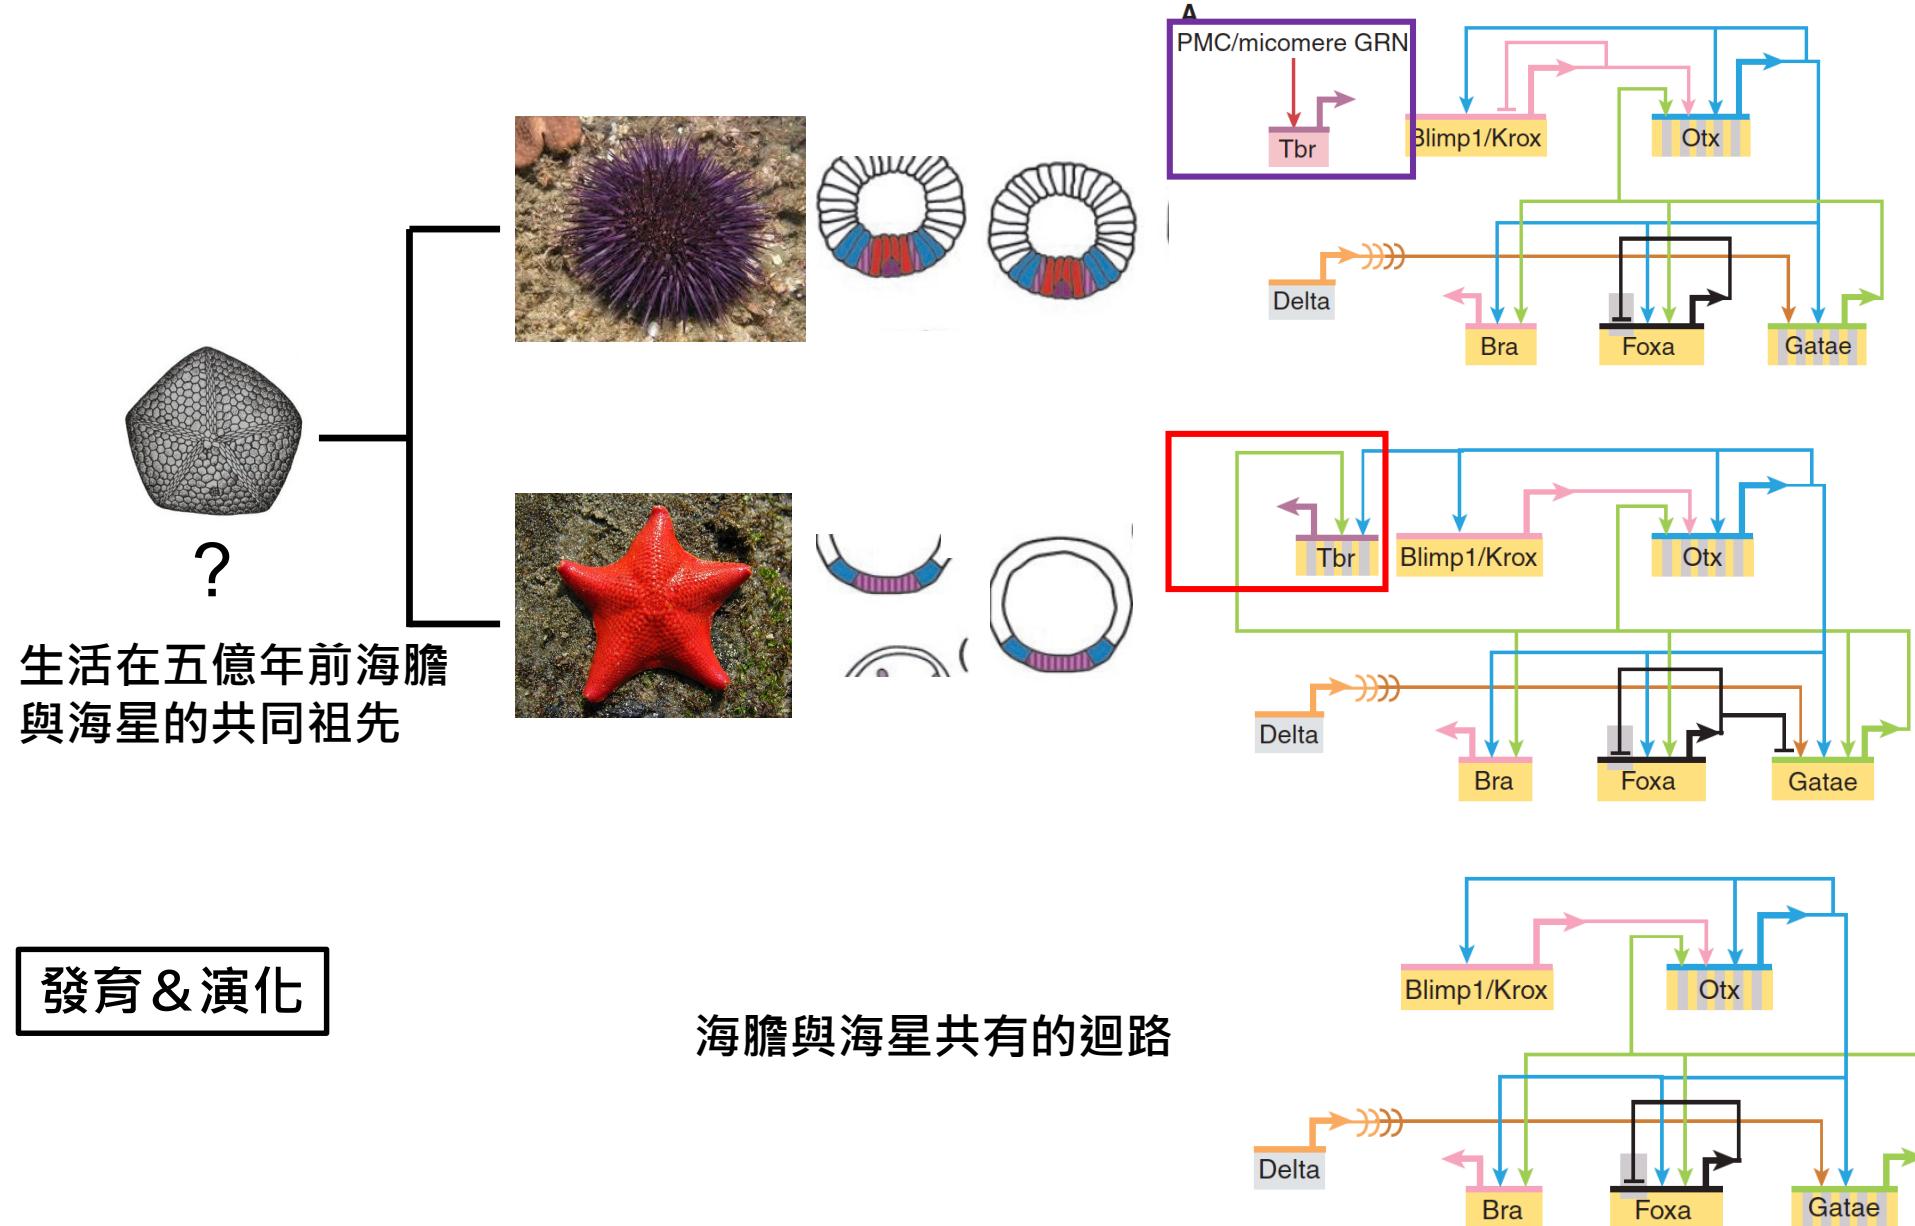

The current VFA includes not yet published cis-regulatory data of Smadar de Leon, Joel Smith (in press), Andrew Cameron, Qiang Tu, Sagar Damle, Andrew Ransick, Christina Theodoris, and, in addition to published data, is based on recent perturbation and other results of Isabelle Peter (endoderm domains), Stefan Materna (NSM domain), and Joel Smith (CP domains) of the Davidson Lab. Relevant perturbation and expression data from these studies are presented here.

This "Up to 30 Hour Overview" primarily shows the endomesoderm network architecture as it exists after 21 hours, with the addition of all PMC components starting at 6 hours, the inclusion of the Delta-Notch signal from PMC to Veg2, the presence of Wnt8 in Veg2 Endoderm, the nβ-Tcf and Otx inputs into Blimp1 in NSM, and Gene X in the NSM; the latter four of these features are no longer present by 21 hours. Consult the other models to see all the network elements and interactions in the correct temporal context.
